Applies to adults ages 18 and older. Based on information from the Institute of Medicine (2002), Dietary Reference Intakes For Energy, Carbohydrate, Fiber, Fat, Fatty Acids, Cholesterol, Protein, And Amino Acids, Part I, pp83-206, Washington, D.C., National Academy of Sciences.

Body Fat: A certain amount of fat is absolutely necessary for good health. Fat plays an important role in protecting internal organs, providing energy, and regulating hormones. The minimal amount of "essential fat" is approximately 3-5% for men, and 12-15% for women. If too much fat accumulates over time, health may be compromised (see table below).

Fat Free Mass: Fat free mass is everything except fat. It includes muscle, water, bone, and internal organs. Muscle is the "metabolic engine" of the body that burns calories (fat) and plays an important role in maintaining strength and energy. Healthy levels of fat-free mass contribute to physical fitness and may prevent conditions such as osteoporosis.

	BODY FAT RATING	MEN	WOMEN	EXPLANATION
	Risky (high body fat)	>30%	>40%	Ask your health care professional about how to safely modify your body composition.
	Excess Fat	21 - 30%	31 - 40%	Indicates an excess accumulation of fat over time.
X	Moderately Lean	13 - 20%	23 - 30%	Fat level is generally acceptable for good health.
	Lean	9 - 12%	19 - 22%	Lower body fat levels than many people. This range is generally excellent for health and longevity.
	Ultra Lean	5 - 8%	15 - 18%	Fat levels often found in elite athletes.
	Risky (low body fat)	<5%	<15%	Ask your health care professional about how to safely modify your body composition.
